

## TRIGONOMETRIC AND LOGARITHMIC FUNCTIONS

Included with many C++ compilers are also trigonometric and logarithmic library functions. These functions, shown in Table 9-2, also require that `math.h` be included in the calling program.

### Note

The trigonometric functions work with angles in radians rather than degrees.

FUNCTION	PROTOTYPE	DESCRIPTION
<code>cos</code>	<code>double cos(double x);</code>	Calculates the cosine of <i>x</i>
<code>sin</code>	<code>double sin(double x);</code>	Calculates the sine of <i>x</i>
<code>tan</code>	<code>double tan(double x);</code>	Calculates the tangent of <i>x</i>
<code>acos</code>	<code>double acos(double x);</code>	Calculates the arc cosine of <i>x</i>
<code>asin</code>	<code>double asin(double x);</code>	Calculates the arc sine of <i>x</i>
<code>atan</code>	<code>double atan(double x);</code>	Calculates the arc tangent of <i>x</i>
<code>atan2</code>	<code>double atan2(double y, double x);</code>	Calculates the arc tangent of <i>y/x</i>
<code>cosh</code>	<code>double cosh(double x);</code>	Calculates the hyperbolic cosine of <i>x</i>
<code>sinh</code>	<code>double sinh(double x);</code>	Calculates the hyperbolic sine of <i>x</i>
<code>tanh</code>	<code>double tanh(double x);</code>	Calculates the hyperbolic tangent of <i>x</i>
<code>exp</code>	<code>double exp(double x);</code>	Calculates the exponential function $e^x$
<code>log</code>	<code>double log(double x);</code>	Calculates the natural logarithm of <i>x</i>
<code>log10</code>	<code>double log10(double x);</code>	Calculates the base 10 logarithm of <i>x</i>

TABLE 9-2

## EXERCISE 9-11

### TRIG AND LOG FUNCTIONS

- Write a program that prompts the user for a variable of type `double` and returns the cosine, sine, tangent, and natural logarithm of the value entered.
- Save the source code as *TRIGLOG.CPP* and close.

## FUNCTIONS FOR WORKING WITH CHARACTERS

C++ compilers also include many functions for analyzing and changing characters. The header file `ctype.h` must be included for a calling program to use the functions listed in Table 9-3. The conditional functions in the table return a non-zero integer if the condition is true and zero if the condition is false.

FUNCTION	PROTOTYPE	DESCRIPTION
<code>isupper</code>	<code>int isupper(int c);</code>	Determines if a character is upper case
<code>islower</code>	<code>int islower(int c);</code>	Determines if a character is lower case
<code>isalpha</code>	<code>int isalpha(int c);</code>	Determines if a character is a letter (a-z, A-Z)
<code>isdigit</code>	<code>int isdigit(int c);</code>	Determines if a character is a digit (0-9)
<code>toupper</code>	<code>int toupper(int c);</code>	Convert a character to uppercase
<code>tolower</code>	<code>int tolower(int c);</code>	Convert a character to lowercase

TABLE 9-3

## EXERCISE 9-12

### CHARACTER FUNCTIONS

- Write a program that accepts a single character as input and uses the character functions to report back to the user the following information:
  - Whether the character is a letter, a digit, or some other type of character.
  - If the character is a letter, tell the user whether the letter is uppercase or lowercase.
- Save the source code as *CHARFUN.CPP* and close.

## SECTION 9.3 QUESTIONS

- What is the term for functions that come with your compiler?
- What do you do to provide prototypes for functions that come with your compiler?
- What does the `pow10` function do?
- What type of variable is passed to the `sqrt` function?
- Write a function call that returns the tangent of 1.0.
- What library function can be used to convert a character to uppercase?

## KEY TERMS

argument	parameter
automatic variable	pass
bottom-up design	passing by address
encapsulation	passing by reference
external variable	passing by value
global variable	prototype
header file	scope
library functions	top-down design
local variable	Visual Table of Contents (VTOC)

## SUMMARY

- Designing a program that consists of functions results in code that is better organized, reusable, and easier to debug.
- The syntax of functions you create is very similar to that of the main function. The parentheses after the function name tell the compiler that you are defining a function.
- You must create a prototype for your functions to let the compiler know your function exists. Prototypes are placed at the top of the program.
